1. Assume $\overline{\chi}$ mobservable. Then $Ge^{tA}\overline{\chi}=0$ $\forall t\geq 0$ Since e^{tA} is a continuously differentiable function of t, we can take derivatives of $Ge^{tA}\overline{\chi}$ and we know that all of them are equal to zero \forall $t\geq 0$. Evaluating at t=0 we get

$$C\bar{x}=0$$
 (no derivative, t=0)
 $CA\bar{x}=0$ (first derivative, t=0)
 $CA^2\bar{x}=0$ (2nd derivative, t=0)
 $CA^{n-1}\bar{x}=0$ (n-1'th derivative, t=0)

Conversely, assume $\bar{x} \in \text{null}(Q_0)$. Then $GA^{K}\bar{x} = 0$ for all K = 0, ..., n-1. Now express

by The C-H Thm.

$$Ce^{tA} = C \sum_{k=0}^{n-1} p_k(t) A^k X = 0 \implies X$$
 unobservable.

2, If system {A, B, C, D} not observable Then rank(Qo)=r<n and dim(nuel(Qo)) = n-r > 0.

Let {W₁, W₂,..., W_{n-r}} be a basis for mull(Qo) and let {W₁, V₂,..., V_r} be a basis for the rest of IR? such that {v₁, v₂,..., v_r, w₁,..., w_{n-r}} is a basis for IR?

Let
$$P = [V_1 \ V_2 \ ... \ V_n \ W_n - r]$$
, P is invertible.

Then $Q, P = [CP]$

$$[CAP] = [CP]$$

$$[CA^{-1}P] = [CP]$$

$$[CA^{-1}P] = [CP]$$
Therefore the fact that the last

Since null(Qo) invariant under A, these columns are still in null(Qo)
Since we Enull(Qo) Kel,...,n-r

Then
$$P^{-1}AP = \begin{bmatrix} \overline{A} & 0 \\ \overline{A} & 0 \\ \hline \end{array}$$
 $\begin{bmatrix} \overline{A} & 0 \\ \overline{A} & 0 \\ \hline \end{array}$ $\begin{bmatrix} \overline{A} & 0 \\ \overline{A} & 0 \\ \hline \end{array}$ $\begin{bmatrix} \overline{A} & 0 \\ \overline{A} & 0 \\ \hline \end{array}$ $\begin{bmatrix} \overline{A} & 0 \\ \overline{A} & 0 \\ \hline \end{bmatrix}$ $\begin{bmatrix} \overline{A} & 0 \\ \overline{A} & 0 \\ \hline \end{bmatrix}$ $\begin{bmatrix} \overline{A} & 0 \\ \overline{A} & 0 \\ \hline \end{bmatrix}$ $\begin{bmatrix} \overline{A} & 0 \\ \overline{A} & 0 \\ \hline \end{bmatrix}$ $\begin{bmatrix} \overline{A} & 0 \\ \overline{A} & 0 \\ \hline \end{bmatrix}$ $\begin{bmatrix} \overline{A} & 0 \\ \overline{A} & 0 \\ \hline \end{bmatrix}$ $\begin{bmatrix} \overline{A} & 0 \\ \overline{A} & 0 \\ \hline \end{bmatrix}$ $\begin{bmatrix} \overline{A} & 0 \\ \overline{A} & 0 \\ \hline \end{bmatrix}$ $\begin{bmatrix} \overline{A} & 0 \\ \overline{A} & 0 \\ \hline \end{bmatrix}$ $\begin{bmatrix} \overline{A} & 0 \\ \overline{A} & 0 \\ \hline \end{bmatrix}$ $\begin{bmatrix} \overline{A} & 0 \\ \overline{A} & 0 \\ \hline \end{bmatrix}$ $\begin{bmatrix} \overline{A} & 0 \\ \overline{A} & 0 \\ \hline \end{bmatrix}$ $\begin{bmatrix} \overline{A} & 0 \\ \overline{A} & 0 \\ \hline \end{bmatrix}$ $\begin{bmatrix} \overline{A} & 0 \\ \overline{A} & 0 \\ \hline \end{bmatrix}$ $\begin{bmatrix} \overline{A} & 0 \\ \overline{A} & 0 \\ \hline \end{bmatrix}$ $\begin{bmatrix} \overline{A} & 0 \\ \overline{A} & 0 \\ \hline \end{bmatrix}$ $\begin{bmatrix} \overline{A} & 0 \\ \overline{A} & 0 \\ \hline \end{bmatrix}$ $\begin{bmatrix} \overline{A} & 0 \\ \overline{A} & 0 \\ \hline \end{bmatrix}$ $\begin{bmatrix} \overline{A} & 0 \\ \overline{A} & 0 \\ \hline \end{bmatrix}$ $\begin{bmatrix} \overline{A} & 0 \\ \overline{A} & 0 \\ \hline \end{bmatrix}$ $\begin{bmatrix} \overline{A} & 0 \\ \overline{A} & 0 \\ \hline \end{bmatrix}$ $\begin{bmatrix} \overline{A} & 0 \\ \overline{A} & 0 \\ \hline \end{bmatrix}$ $\begin{bmatrix} \overline{A} & 0 \\ \overline{A} & 0 \\ \hline \end{bmatrix}$ $\begin{bmatrix} \overline{A} & 0 \\ \overline{A} & 0 \\ \hline \end{bmatrix}$ $\begin{bmatrix} \overline{A} & 0 \\ \overline{A} & 0 \\ \hline \end{bmatrix}$ $\begin{bmatrix} \overline{A} & 0 \\ \overline{A} & 0 \\ \hline \end{bmatrix}$ $\begin{bmatrix} \overline{A} & 0 \\ \overline{A} & 0 \\ \hline \end{bmatrix}$ $\begin{bmatrix} \overline{A} & 0 \\ \overline{A} & 0 \\ \hline \end{bmatrix}$ $\begin{bmatrix} \overline{A} & 0 \\ \overline{A} & 0 \\ \hline \end{bmatrix}$ $\begin{bmatrix} \overline{A} & 0 \\ \overline{A} & 0 \\ \hline \end{bmatrix}$ $\begin{bmatrix} \overline{A} & 0 \\ \overline{A} & 0 \\ \hline \end{bmatrix}$ $\begin{bmatrix} \overline{A} & 0 \\ \overline{A} & 0 \\ \hline \end{bmatrix}$ $\begin{bmatrix} \overline{A} & 0 \\ \overline{A} & 0 \\ \hline \end{bmatrix}$ $\begin{bmatrix} \overline{A} & 0 \\ \overline{A} & 0 \\ \hline \end{bmatrix}$ $\begin{bmatrix} \overline{A} & 0 \\ \overline{A} & 0 \\ \hline \end{bmatrix}$ $\begin{bmatrix} \overline{A} & 0 \\ \overline{A} & 0 \\ \hline \end{bmatrix}$ $\begin{bmatrix} \overline{A} & 0 \\ \overline{A} & 0 \\ \hline \end{bmatrix}$ $\begin{bmatrix} \overline{A} & 0 \\ \overline{A} & 0 \\ \hline \end{bmatrix}$ $\begin{bmatrix} \overline{A} & 0 \\ \overline{A} & 0 \\ \hline \end{bmatrix}$ $\begin{bmatrix} \overline{A} & 0 \\ \overline{A} & 0 \\ \hline \end{bmatrix}$ $\begin{bmatrix} \overline{A} & 0 \\ \overline{A} & 0 \\ \hline \end{bmatrix}$ $\begin{bmatrix} \overline{A} & 0 \\ \overline{A} & 0 \\ \hline \end{bmatrix}$ $\begin{bmatrix} \overline{A} & 0 \\ \overline{A} & 0 \\ \hline \end{bmatrix}$ $\begin{bmatrix} \overline{A} & 0 \\ \overline{A} & 0 \\ \hline \end{bmatrix}$ $\begin{bmatrix} \overline{A} & 0 \\ \overline{A} & 0 \\ \hline \end{bmatrix}$ $\begin{bmatrix} \overline{A} & 0 \\ \overline{A} & 0 \\ \hline \end{bmatrix}$ $\begin{bmatrix} \overline{A} & 0 \\ \overline{A} & 0 \\ \hline \end{bmatrix}$ $\begin{bmatrix} \overline{A} & 0 \\ \overline{A} & 0 \\ \hline \end{bmatrix}$ $\begin{bmatrix} \overline{A} & 0 \\ \overline{A} & 0 \\ \hline \end{bmatrix}$ $\begin{bmatrix} \overline{A} & 0 \\ \overline{A} & 0 \\ \hline \end{bmatrix}$ $\begin{bmatrix} \overline{A} & 0 \\ \overline{A} & 0 \\ \hline \end{bmatrix}$ $\begin{bmatrix} \overline{A} & 0 \\ \overline{A} & 0 \\ \hline \end{bmatrix}$ $\begin{bmatrix} \overline{A} & 0 \\ \overline{A} & 0 \\ \hline \end{bmatrix}$ $\begin{bmatrix} \overline{A} & 0 \\ \overline{A} & 0 \\ \hline \end{bmatrix}$ $\begin{bmatrix} \overline{A} & 0 \\ \overline{A} & 0 \\ \hline \end{bmatrix}$ $\begin{bmatrix} \overline{A} & 0 \\ \overline{A} & 0 \\ \hline \end{bmatrix}$ $\begin{bmatrix} \overline{A} & 0 \\ \overline{A} & 0 \\ \hline \end{bmatrix}$ $\begin{bmatrix} \overline{A} & 0 \\ \overline{A} & 0 \\ \hline \end{bmatrix}$ $\begin{bmatrix} \overline{A} & 0 \\ \overline{A} & 0 \\ \hline \end{bmatrix}$ $\begin{bmatrix} \overline{A} & 0 \\ \overline{A} & 0 \\ \hline \end{bmatrix}$ $\begin{bmatrix} \overline{A} & 0 \\ \overline{A} & 0 \\ \hline \end{bmatrix}$ $\begin{bmatrix} \overline{A} & 0 \\ \overline{A} & 0 \\ \hline \end{bmatrix}$ $\begin{bmatrix} \overline{A} & 0 \\ \overline{A} & 0 \\ \hline \end{bmatrix}$ $\begin{bmatrix} \overline{A} & 0 \\ \overline{A}$

Finally, let
$$P^{-1}B = \begin{bmatrix} \overline{B} \\ \hline ? \end{bmatrix}$$
 $n-r$

Then $\hat{G}(s) = G(sI-A)^{-1}B+D = CP(sI-P^{-1}AP)^{-1}P^{-1}B+D$ $= \begin{bmatrix} \bar{C} & \vdots & 0 \end{bmatrix} \begin{bmatrix} sI_r - \bar{A} & \vdots & 0 \\ \vdots & sI_{n-r} - ? \end{bmatrix} \begin{bmatrix} \bar{B} & \vdots \\ 0 & \vdots & sI_{n-r} - ? \end{bmatrix}$

= $C(sI_r-A)B+D$ set D=D and me see that $\{A,B,C,D\}$ not a minimal realization.

3, chen 7.12

First system: $G(sI-A)^{-1}B = [2 \ 2] \begin{bmatrix} s-2 \ 0 \end{bmatrix} \begin{bmatrix} 1 \ 0 \end{bmatrix}$ $= [2 \ 2] \cdot \frac{1}{(s-2)(s-1)} \begin{bmatrix} s-1 \ 0 \end{bmatrix} \begin{bmatrix} 1 \ 0 \end{bmatrix} = \frac{2(s-1)}{(s-2)(s-1)}$ $= \frac{2}{s-2} = \frac{2(s+1)}{(s-2)(s+1)} = \frac{2s+2}{s^2-s-2} \quad \text{(not minimal.)}$

Second system: $C(sI-A)^{-1}B = \begin{bmatrix} 2 & 0 \end{bmatrix} \begin{bmatrix} s-2 & 0 \\ 1 & s+1 \end{bmatrix} \begin{bmatrix} 1 \\ 2 \end{bmatrix}$ $= \begin{bmatrix} 2 & 0 \end{bmatrix} \cdot \frac{1}{(s-2)(s+1)} \begin{bmatrix} s+1 & 0 \\ -1 & s-2 \end{bmatrix} \begin{bmatrix} 1 \\ 2 \end{bmatrix}$

both realizations are not minimal, more over since the evalues of the A natrices from system I and system 2 are not equal, there cannot exist P such that $A_2 = P^{-1}A_1P_1$ Hence not algebraicly equivalent.

4. Minimal realization first:

diffeq:
$$y(t) + y(t) = u(t)$$
, Let $x(t) = \begin{bmatrix} y(t) \\ \ddot{y}(t) \end{bmatrix}$

Then
$$\dot{x} = \begin{bmatrix} \dot{y} \\ \dot{y} \\ \dot{y} \end{bmatrix} = \begin{bmatrix} 0 & 1 & 0 \\ 0 & 0 & 1 \\ -1 & 0 & 0 \end{bmatrix} \begin{bmatrix} \dot{y} \\ \dot{y} \end{bmatrix} + \begin{bmatrix} 0 \\ 0 \\ 1 \end{bmatrix} u$$

The output equation follows immediately; $y = [100] \times$ with D = 0.

How do we know this is minimal? First, since g(s) is expressed with no common poles/zeros, then a minimal system will have dimension equal to the degree of the denominator. This is true here. Another check is for check if the system is both reachable. & observable.

$$Q_r = \begin{bmatrix} B & AB & A^2B \end{bmatrix} = \begin{bmatrix} 0 & 0 & 1 \\ 0 & 1 & 0 \\ 1 & 0 & 0 \end{bmatrix} \leftarrow rank = 3 \Leftrightarrow reachable$$

$$Q_0 = \begin{bmatrix} C \\ CA \\ CA^2 \end{bmatrix} = \begin{bmatrix} 1 & 0 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 1 \end{bmatrix} \leftarrow rank = 3 \iff observable.$$

Hence system is minimal.

easiest way to do this is to add a common factor to the numerator & denominator of g(s) and then find observable canonical form.

$$\frac{1}{3}(5) = \frac{1}{5^3 + 1} = \frac{5}{5^4 + 5}$$

Observable canonical form directly from g(s): (see Chen pp. 188)

$$A = \begin{bmatrix} 0 & 1 & 0 & 0 \\ 0 & 0 & 1 & 0 \\ -1 & 0 & 0 & 1 \\ 0 & 0 & 0 & 0 \end{bmatrix} \quad B = \begin{bmatrix} 0 \\ 0 \\ 1 \\ 0 \end{bmatrix} \quad C = \begin{bmatrix} 1 & 0 & 0 & 0 \end{bmatrix} \quad D = 0.$$

check observability:
$$Q_0 = \begin{bmatrix} C \\ CA \\ CA^2 \\ CA^3 \end{bmatrix} = \begin{bmatrix} 1 & 0 & 0 & 0 \\ 0 & 1 & 0 & 0 \\ 0 & 0 & 1 & 0 \\ -1 & 0 & 0 & 1 \end{bmatrix} \Rightarrow rank = 4 \iff 0 \text{ observable}$$

not minimal + observable => not reachable, check:

$$Q_r = [B AB A^2B A^3B] = \begin{bmatrix} 0 & 0 & 1 & 0 \\ 0 & 1 & 0 & 0 \\ 1 & 0 & 0 & 0 \end{bmatrix} \rightarrow rank = 3 \iff not reachable V$$

· reachable but not observable now:

Same idea as before except use reachable/controllable canonical form;

$$A = \begin{bmatrix} 0 & 0 & -1 & 0 \\ 1 & 0 & 0 & 0 \\ 0 & 1 & 0 & 0 \\ 0 & 0 & 1 & 0 \end{bmatrix} \quad B = \begin{bmatrix} 1 \\ 0 \\ 0 \\ 0 \end{bmatrix} \quad C = \begin{bmatrix} 0 & 0 & 1 & 0 \end{bmatrix} \quad D = 0$$

$$Q_r = \begin{bmatrix} B & AB & A^2B & A^3B \end{bmatrix} = \begin{bmatrix} 1 & 0 & 0 & -1 \\ 0 & 1 & 0 & 0 \\ 0 & 0 & 1 & 0 \\ 0 & 0 & 0 & 1 \end{bmatrix} \rightarrow rank = 4 reachable$$

$$Q_0 = \begin{bmatrix} c \\ cA \\ cA^2 \\ CA^2 \end{bmatrix} = \begin{bmatrix} 0 & 0 & 1 & 0 \\ 0 & 1 & 0 & 0 \\ 1 & 0 & 0 & 0 \\ 0 & 0 & -1 & 0 \end{bmatrix} \rightarrow rank = 3, not observable.$$

5. a) Based on results from last homework, rank (Qr)=1 and since n>1, this system is not reachable > not minimal.

To find a minimal realization, we will take the existing realization & reduce it.

V is a basis for range Qr. Let $P = [V \ W_1 \dots W_{n-1}]$ where $W_1 \dots W_{n-1}$ are vectors in \mathbb{R}^n chosen such that $\{V_1, W_1, \dots, W_{n-1}\}$ formal linearly independent set. Then

Since
$$B = V$$
, express $B = P\begin{bmatrix} \overline{B} \\ \overline{O} \end{bmatrix}$ where $\overline{B} = 1$

Let D=0.

Claim that a minimal realization is

$$\overline{A} = -||v||^2$$

$$\overline{B} = 1$$

$$\overline{C} = ||v||^2$$

$$\overline{D} = 0$$

, by similarity transform.

$$= \begin{bmatrix} \overline{c} & : stuff \end{bmatrix} \begin{bmatrix} s + ||v||^2 & ? \\ \overline{c} & : sI_{n-1} - ? \end{bmatrix} \begin{bmatrix} \overline{B} \\ \overline{c} \\ \overline{c$$

using inverse of block diagonal matrix...

= C(SI, -A) -B + shows that {A,B,C,D} indeed a realization.

Is it minimal? $Q_r = B = 1$, rank= $1 = n \implies \text{reachable}$ $Q_o = \overline{C} = ||V||^2$, since $V \neq 0$, rank($Q_o = 1 \implies \text{observable}$) minimal.

- because A has n-1 evalues agreed to 0. A not Hurwitz = system not A.S.
- c) The new system is asymptotically stuble, $A = -\|v\|^2 \text{ has one "evalue" at } \lambda = -\|v\|^2 < 0$

A Hurwitz > minimal system is A.S.

The point here is that if you have a minimal system that is A.S., non minimal realizations of this same system may not share this property since asymptotic stability describes internal behavior.

BIBO stability, honever, is not affected by The minimality or nonminimality of the realization.

6.
$$G(s) = \begin{bmatrix} s-1 \\ \overline{s} \end{bmatrix}$$
 0 $\frac{3-2}{s+2}$ 0

First order minors: 5-1, 5-2, 5+1, 0

Second order minors: $\frac{(s-1)(s+1)}{s^2}$, 0, $\frac{(s+1)(s-2)}{s(s+2)}$

Least common denominator: 52 (s+2) => McMillan degree = 3,

Any valid realization of order 3 is then minimal. We just need to find A, B, C, D.

Dis easy.
$$\lim_{s\to\infty} \hat{G}(s) = \begin{bmatrix} 1 & 0 & 1 \\ 0 & 1 & 0 \end{bmatrix} = D$$

The strictly proper part of $\hat{G}(s)$ is then $\begin{bmatrix} -\frac{1}{5} & 0 & -\frac{11}{5+2} \\ 0 & \frac{1}{5} & 0 \end{bmatrix} = C(sI-A)^{-1}B$

BEIR^{3×3} AEIR^{3×3} CEIR^{2×3}

Lots of zeros in this TF so The best approach is to just realize each transfer function and Then assemble The whole thing into a realization.

$$y_{1}(s) = -\frac{1}{5}y_{1}(s) \implies x_{1} = y_{1}, y_{2} = -x_{1}, y_{1}(s) = \frac{1}{5}y_{2}(s) \implies x_{2} = -2x_{2} + y_{3}, y_{3} = -1/x_{2}$$

superposition:

$$\begin{aligned}
y_1 &= \begin{bmatrix} -7 \\ -4 \end{bmatrix} \begin{bmatrix} x_{12} \\ x_{2} \end{bmatrix} \\
x &= \begin{bmatrix} 0 \\ 0 \end{bmatrix} \begin{bmatrix} 0 \\ -2 \end{bmatrix} \begin{bmatrix} x_{12} \\ x_{2} \end{bmatrix} \\
0 & 0 \end{bmatrix} \begin{bmatrix} u_1 \\ u_2 \\ u_3 \end{bmatrix}$$

check: $G(sI-A)^{-1}B = [-1 - 4][s \ o \]^{-1}[l \ o \ o]$

$$= \begin{bmatrix} -1 & -4 \end{bmatrix} \begin{bmatrix} \frac{1}{5} & 0 \\ 0 & \frac{1}{5+2} \end{bmatrix} \begin{bmatrix} 1 & 0 & 0 \\ 0 & 0 & 1 \end{bmatrix}$$

$$= \begin{bmatrix} -1 & -4 \end{bmatrix} \begin{bmatrix} \frac{1}{5} & 0 & 0 \\ 0 & 0 & \frac{1}{5+2} \end{bmatrix} = \begin{bmatrix} -\frac{1}{5} & 0 & \frac{-2}{5+2} \end{bmatrix} \checkmark$$

Now
$$y_2(s) = \frac{1}{5} u_2(s) \implies x_3 = u_2, y_2 = x_3$$

put it all together:

$$\dot{x} = \begin{bmatrix} 0 & 0 & 0 \\ 0 & -2 & 0 \\ 0 & 0 & 0 \end{bmatrix} x + \begin{bmatrix} 1 & 0 & 0 \\ 0 & 0 & 1 \\ 0 & 1 & 0 \end{bmatrix} \begin{bmatrix} u_1 \\ u_2 \\ u_3 \end{bmatrix}$$

$$\dot{y} = \begin{bmatrix} -1 & -4 & 0 \\ 0 & 0 & 1 \end{bmatrix} x + \begin{bmatrix} 1 & 0 & 1 \\ 0 & 1 & 0 \end{bmatrix} \begin{bmatrix} u_1 \\ u_2 \\ u_3 \end{bmatrix}$$

checks with Maxlab.

7. Want to find F such that A BF has evalues at -2 and -1 = j.

$$A = \begin{bmatrix} t & 1 - 2 \\ 0 & t & 1 \end{bmatrix}$$

$$B = \begin{bmatrix} 1 \\ 0 \end{bmatrix}$$

$$A - BF = \begin{bmatrix} 1 - f_1 & 1 - f_2 & -2 - f_3 \\ 0 & -f_1 & -f_2 & 1 - f_3 \end{bmatrix}$$

Use direct method, $\det(\lambda I_3 - (A-BF)) = (\lambda + f_1 - 1)[(\lambda - 1)(\lambda + f_2 - 1) + f_2] + f_1[(f_2 - 1)(-1) - (\lambda + 1)(2 + f_3)]$ $= \lambda^3 + 4\lambda^2 + 6\lambda + 4$

Simplify... set powers equal.

$$(f_3 + f_1 - B)\chi^2 = 4\chi^2$$
 Unique solution
 $(-4f_1 + f_2 - 2f_3 + 3)\lambda = 6\chi$ \Rightarrow $F = [15 47 - 8]$
 $(4f_1 - f_2 + f_3 - 1) = 4$ checks w/ Matlab.

8. Want to see what e-values can be achieved with state feedback.

direct method possible but hard. Better idea is to use similarity transform to simplify the problem, men direct method.

Want
$$B = P^{-1}B = \begin{bmatrix} 0 \\ 1 \\ 0 \end{bmatrix}$$
 (less f's will appear in $\overline{A} = \overline{B} \overline{F}$)

can find This P^{-1} without even using Matlab, ... $P^{-1} = \begin{bmatrix} 1 & 0 & 0 & 0 \\ 0 & 1 & 0 & 0 \\ 0 & 0 & 1 & -1 \\ 0 & -1 & 0 & 1 \end{bmatrix}$

Then
$$P = \begin{bmatrix} 1000\\ 0100\\ 0111\\ 0101 \end{bmatrix}$$

$$A = P^{-1}AP = \begin{bmatrix} 2 & 1 & 0 & 0 \\ 0 & 2 & 0 & 0 \\ 0 & 0 & -1 & 0 \\ 0 & -3 & 0 & -1 \end{bmatrix}$$

hence
$$\left| \lambda \bar{I}_{4} - (\bar{A} - \bar{B}\bar{F}) \right| = \left| \lambda - 2 - 1 \right| 0$$

 $\left| f_{1} \right| \lambda - 2 + f_{2} = f_{3} = f_{4}$
 $\left| 0 \right| 0 = \lambda + 1 = 0$
 $\left| 0 \right| 0 = \lambda + 1 = 0$
 $\left| 0 \right| 0 = \lambda + 1 = 0$
 $\left| 0 \right| 0 = \lambda + 1 = 0$

however, I'm stuck with an e-value at -1. No choice of F will change this e-value.

This implies that we can find F that achieves the evalue sets {-2,-2,-1,-1}, {-2,-2,-2,-1}, but not {2,-2,-2,-2}.

The system is thus stabilizable.
